Dipartimento di Medicina Interna,

Università di Genova

Genova, Italia

Introduction (I)

Proactive TDM

Reactive TDM

Introduction (II)

Use of Therapeutic Drug Monitoring (TDM) for anti-TNF agents

	ELISA	HMSA
1. Execution Time	4-6 h	1 h
2. Phase	Solid	Liquid
3. Accuracy for measuring anti-TNF α serum concentrations	Qualitative	High
4. Accuracy for detecting anti-drug antibodies	Drug sensitive/tolerant	High/quantitative
5. Antibodies inconclusive	Positive	Negative
6. Aspecific interferences	High	Low
7. Antibodies type	IgG	Different subtypes and subclasses

TIME CONSUMING

Introduction (III)

Point of care

15-20 min

The aim of our study was to:

- ***evaluate the capability of POC to discriminate between IBD relapse and remission;***
- ***evaluate the concordance of drug TL measured with POC and HMSA.***

Patients and methods

- ▶ Crohn's disease patients (n=46)
 - ▶ 200 infliximab serum samples
 - ▶ 200 adalimumab serum samples
- ▶ Blood samples were drawn at standardized points during anti-TNF treatment (2, 6, and every 8 weeks) or at loss of response
- ▶ Serum samples previously assessed with HMSA were analyzed with point of care
- ▶ Disease activity was assessed using HBI
- ▶ HMSA (Prometheus Inc, San Diego, California, USA)
- ▶ Quantum Blue[®] (Buhlman Laboratories AG, Schenbuch, Switzerland)

Results (I)

		Whole Population (n 46, 100%)	ADA patients (n 25, 54.3%)	IFX patients (n21, 45.7%)
Gender (male)	n (%)	28, 60.1	16, 64	12, 57.1
Age (years)	median (range)	39 (19-60)	39 (19-66)	39 (21-69)
Age<40 at diagnosis,	n (%)	38, 82.6	22, 88	16, 76.2
BMI	median (range)	23 (17-33)	23 (17-33)	24 (17-30)
FU (weeks)	median (range)	83 (16-144)	90 (48-144)	80 (16-138)
Disease duration (years)	median (range)	4.5 (1-22)	6 (1-22)	4 (1-20)
Montreal Classification				
Behaviour				
	B1	18, 39	9, 36	9, 43
	B2	18, 39	10, 40	8, 38
Location	B3	10, 22	6, 24	4, 19
	L1	27, 59	16, 64	11, 52
	L2	5, 11	2, 8	3, 14
	L3	14, 30	7, 28	7, 34
Perianal disease	n (%)	8, 17	4, 16	4, 19
Smoking status				
	Past- smokers	11, 24	6, 24	5, 24
	Active smokers	27, 59	13, 52	14, 67
	No smokers	8, 17	6, 24	2, 9
Previous surgery	n (%)	17, 37	10, 40	7, 33

Results (II)

ADA TL HMSA vs POC (Week 14)

Results (III)

ADA TL HMSA vs POC (End of FU)

Results (IV)

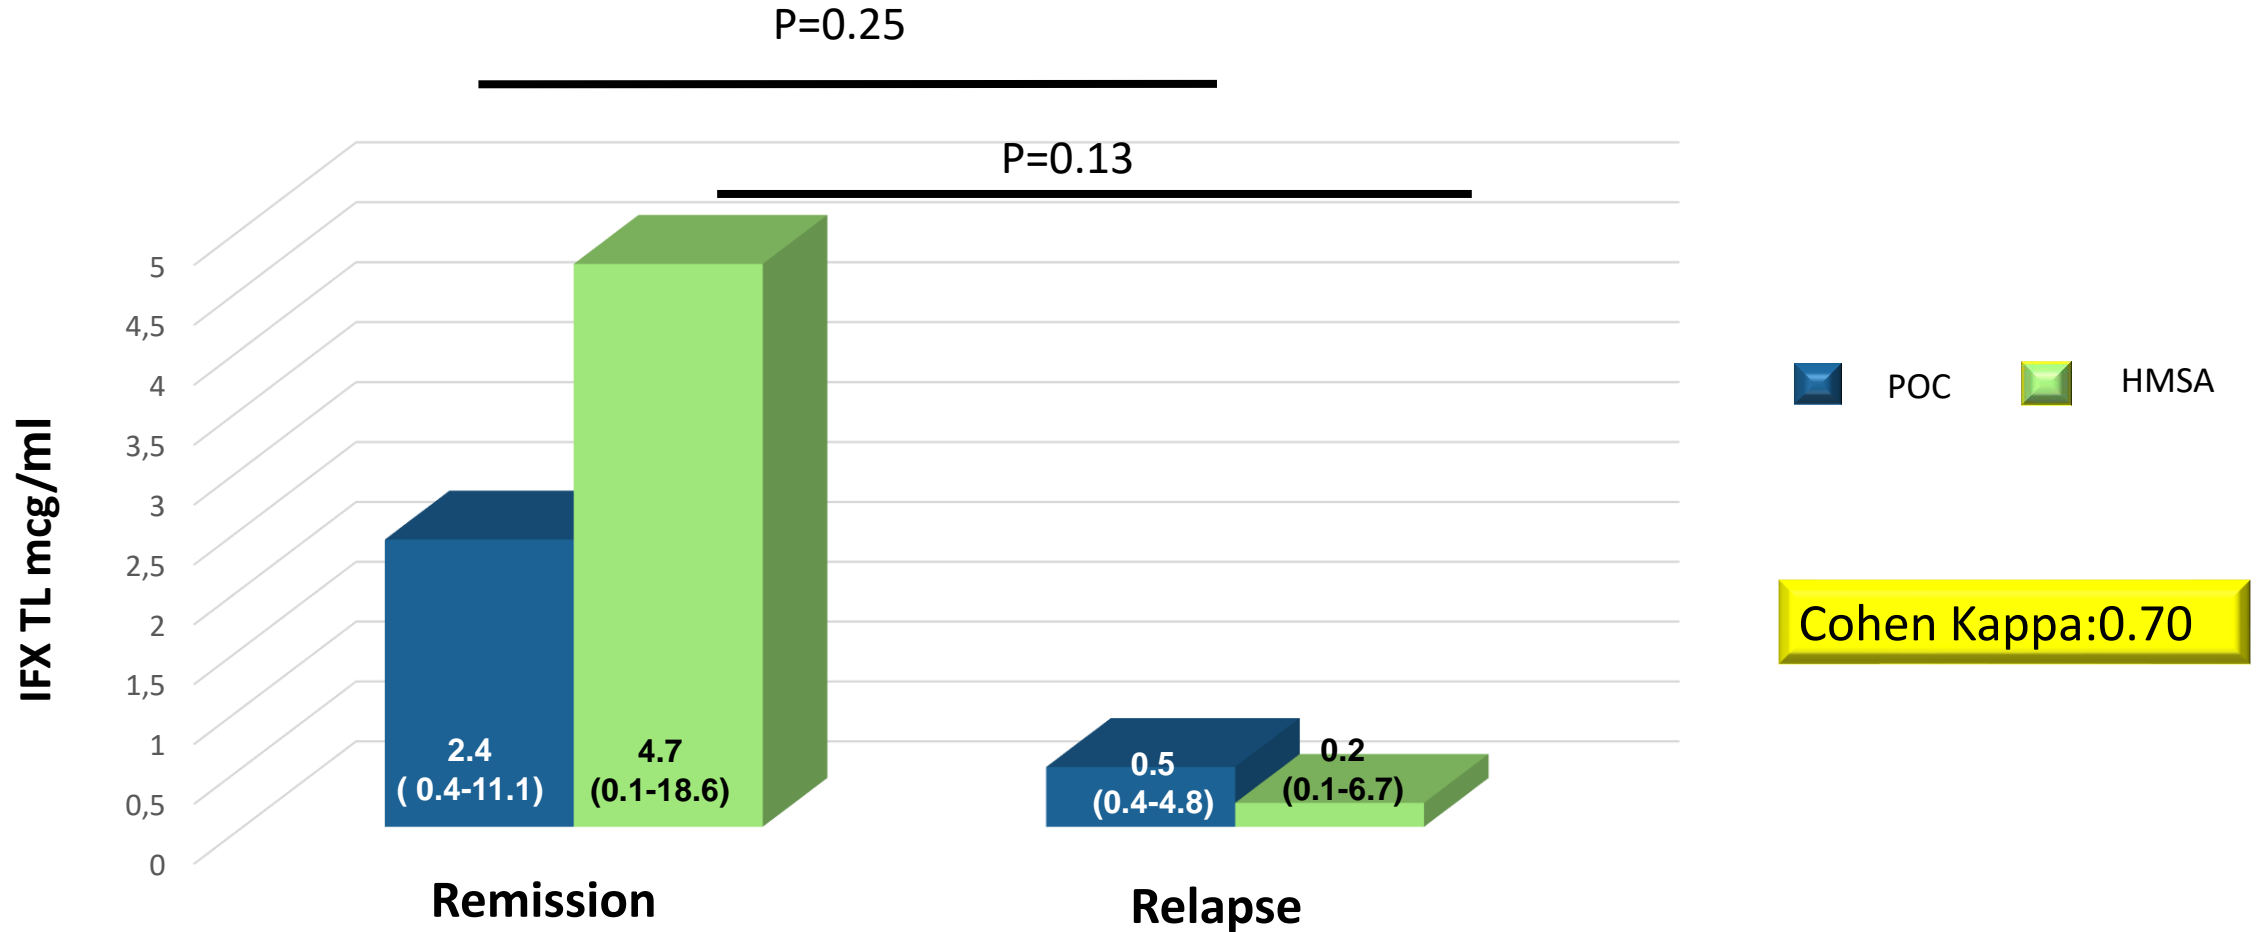

IFX TL HMSA vs POC (Week 14)

Results (V)

IFX TL HMSA vs POC (End of FU)

Results (VI)

Correlation HMSA vs POC

IFX

$r = 0.76$

$p < 0.0001$

95% CI = 0.690-0.810

ADA

$r = 0.75$

$p < 0.0001$

95% CI = 0.688-0.809

Results (VII)

ROC Curve HMSA vs POC

IFX

POC $C_{index} = 0.895$ 95% CI (0.845-0.934)

HMSA $C_{index} = 0.921$ 95%CI (0.874- 0.954)

ADA

POC $C_{index} = 0.850$ 95% CI (0.756-0.868)

HMSA $C_{index} = 0.817$ 95%CI (0.793- 0.896)

Conclusions

Both POC and HMSA are TL tests able to differentiate relapse and remission in IBD patients

The association between anti-TNF TL and disease status (remission/relapse) was better in ADA-treated patients rather than patients treated with IFX

Good concordance, correlation and accuracy between HMSA and POC

Anti-drug antibody concentrations while available on HMSA were not available on POC. This would limit the identification of anti-TNF non-responders on the POC test if a percentage of those were anti-drug antibody positive.
